

*Training Workshop provided by the IUSSP Panel on Early Career Perspectives*

## **IUSSP Webinar Series**

# **Extracting Spatial Data on Environment for Research**

Trainer

**Ankit Sikarwar**

French Institute for Demographic Studies (INED) Paris, France

[sikarwar.ankit-kumar@ined.fr](mailto:sikarwar.ankit-kumar@ined.fr)

25 January 2023

12:00-15:00 UTC

## **Part 1:**

- Concepts and background of spatial data on environment
- Need for open access spatial data
- Applications to demographic research
- Sources to access spatial data on environment

## **Part 2:**

- Hands-on session in QGIS  
(From importing data to extracting the indicators at desired spatial scale)
- Common errors while analysing geospatial data
- Discussion/Q&A

# Concept and background of spatial data on environment

## **What we mean by spatial data?**

- any data directly or indirectly references a specific geographical area or location

## **Spatial data on Environment**

- Indicators of environment for a particular location
- Rainfall, temperature, air pollution, land-use/cover, night time light,.....
- Stemming from ground data and/or earth observations

# Concept and background of spatial data on environment

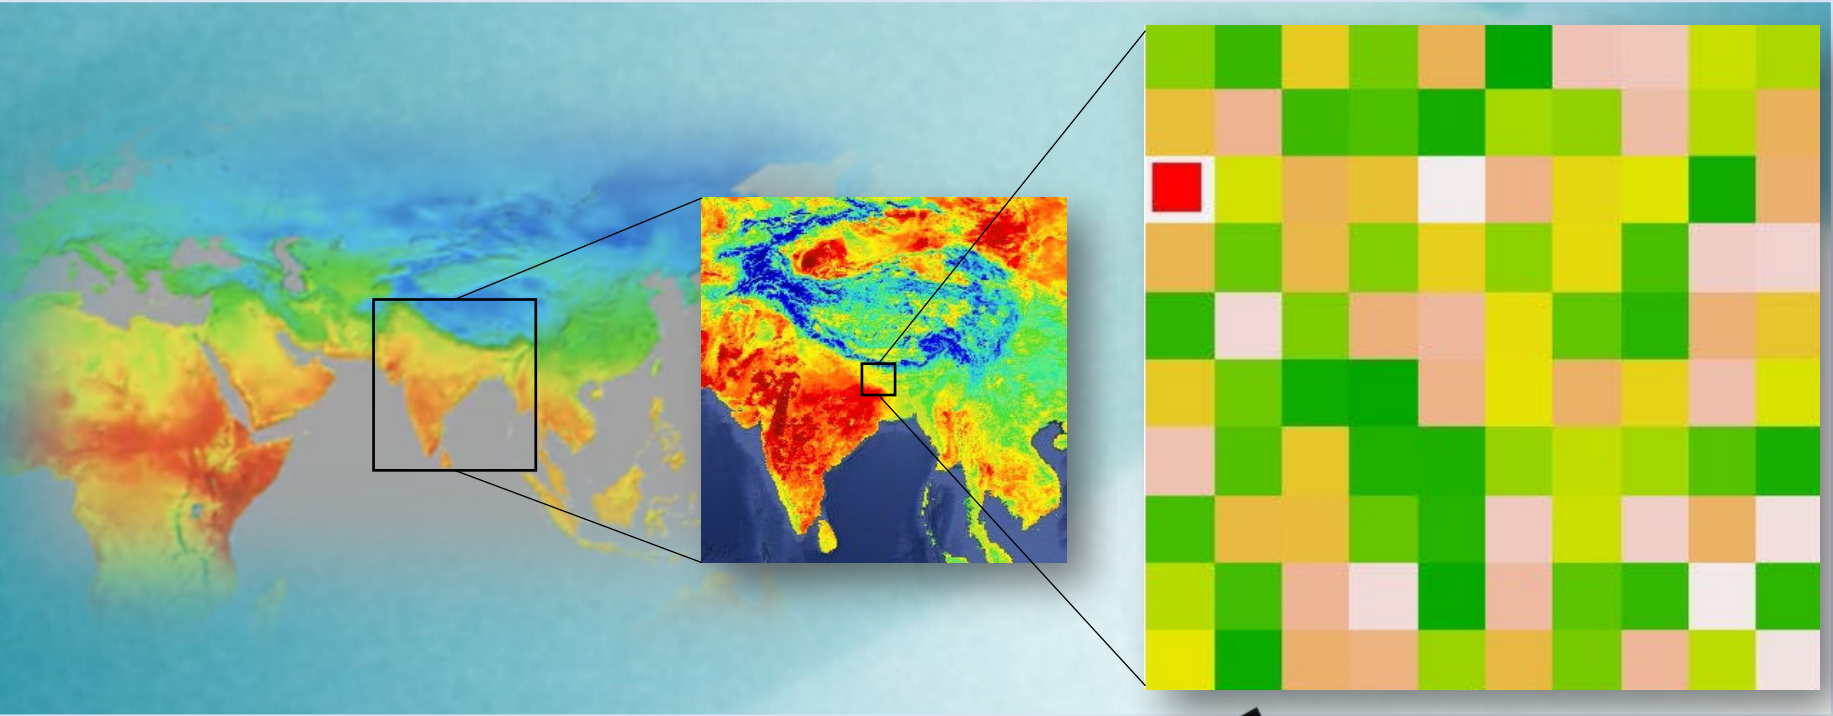

## Form of spatial data on environment

## Form of spatial data on environment

Ready to use  
open-access  
remotely sensed  
data pre-processed  
by experts

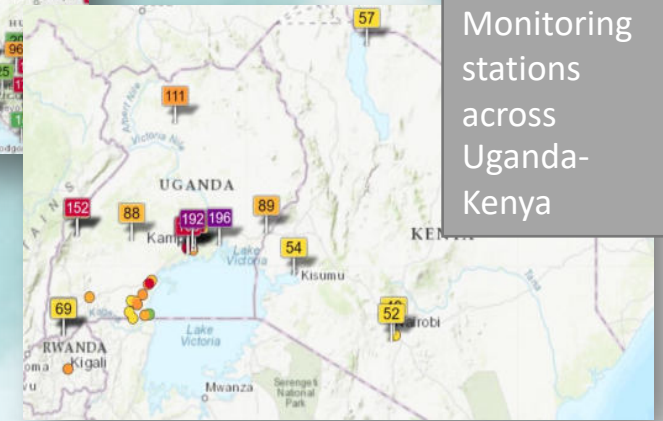

# Need for open access spatial data from earth observations

Extracting  
Spatial Data on  
Environment

- Intensifying and uncertain environmental parameters
- Need to be measured with timely and geographically rich data
- Insufficient number of ground monitoring stations in the global south, where most of the world population reside
- Fine-scale data provides a better understanding of how each variable impacts individuals, communities, populations, etc.
- Research and policy implications by identifying areas with greater environmental challenge and higher population at risk

Air Quality  
Monitoring  
stations  
across  
Europe

# Need for open access spatial data from earth observations

- Direct and indirect use of earth observations and spatial data in monitoring and attainment of multiple targets of the Sustainable Development Goals
- Instrumental in countries where census and survey data on such indicators are not up-to-date and frequent.

Source: Avtar et al. (2020) <https://doi.org/10.1007/s10661-019-7996-9>

## Applications to demographic research

- To explore complex connections of Population-Development-Environment
- Research questions: Where, when, how?
  - ❑ Climate change – migration patterns/socio-economic conditions/ fertility?
  - ❑ Air pollution – mortality and morbidity
  - ❑ Land use change – sustainability
  - ❑ Proximity connections – distance to water body and water-borne diseases
- Gridded population data solving the issues of spatial and temporal scales

# Applications to demographic research

## What type of analysis?

- Depends on research interest, objectives and availability of demographic data.
- Descriptive analyses: looking for correlations between environmental and demographic data - Visually / With classification techniques
- Regression analyses: because physical elements are never the only ones in the balance / in order to assess the respective roles of a set of possible factors, including those derived from the environment.

Pixel level analysis

At individual/household level

At cluster level

At administrative area level

# Applications to demographic research

## Example of Individual level analysis

- 2 villages in Mali
- Demographic data: SLAM data base (1987-1989 to 2009-2010, updated every 5y) covering 1980-2010
- Climate data: CHIRPS database [Climate Hazards Group InfraRed Precipitation with Station] for the location of the 2 villages, over 30 y.  
(Rainfall index combining 4 measures: total seasonal rainfall, rainfall distribution and onset, quality of the past year)

# Applications to demographic research

## Example of cluster level analysis

- Kenya, DHS national survey clusters (2003 and 2008-09)
- 2 DHS Survey data on birthweight at the last birth, as well as explanatory variables
- Livelihood zone (FEWS.NET) and Price data  
FAO/FEWS NET
- NDVI data as a proxy of agricultural productivity  
(from the MODIS instrument on the NASA Terra  
satellite, 2000-) at 250m resolution

# Applications to demographic research

## Example of area level (ecological) analysis

- India, district level
- Demographic data : Covid death counts 2020-2021 till second wave (crowd source data)
- Environmental data : Greenness-NDVI, district averages for Jan-March 2019, 1km, in quintiles (ISRO satellite data)

<sup>c</sup> Aix-Marseille University, IRD, LPED, Marseille, France

## Results

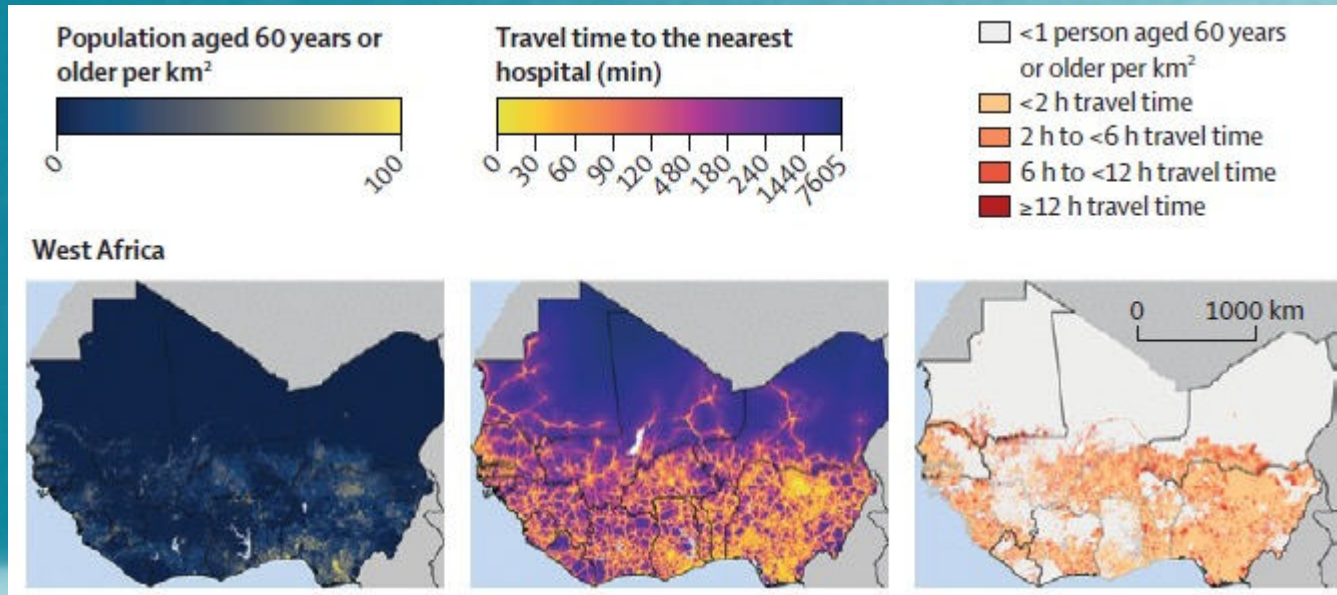

## Example of pixel level analysis

- Africa, 1kmx1km
- Demographic data : Worldpop
- Health facilities geolocations: OpenStreetMap and reports

### Results

## Mapping physical access to health care for older adults in sub-Saharan Africa and implications for the COVID-19 response: a cross-sectional analysis

*Pascal Geldsetzer\*, Marcel Reinmuth\*, Paul O Ouma, Sven Lautenbach, Emelda A Okiro, Till Bärnighausen, Alexander Zipf*

### Summary

**Background** Severe acute respiratory syndrome coronavirus 2, the virus causing COVID-19, is rapidly spreading across sub-Saharan Africa. Hospital-based care for COVID-19 is often needed, particularly among older adults.

*Lancet Healthy Longev 2020;  
1: e32–42*

# Sources to access spatial data on environment

## Weather/Climate data

**CHIRPS:** Climate Hazards center InfraRed Precipitation with Station data  
(Rainfall Estimates from Rain Gauge and Satellite Observations)

“Since 1999, USGS and CHC scientists—supported by funding from USAID, NASA, and NOAA—have developed techniques for producing rainfall maps, especially in areas where surface data is sparse.”

**CRU-TS:** the UK Climate Research Unit’s time series datasets  
(exclusively based on weather stations observation)

The last version, released 26 May 2022, covers the period 1901-2021

*Coverage: All land areas (excluding Antarctica) at 0.5° resolution*

*Variables:* temperature • volume of hydrological precipitation • vapour pressure • wet days • cloud cover

### Demonstration:

Worldclim (temperature and precipitation data at various resolution)

<https://www.worldclim.org/data/worldclim21.html>

# Sources to access spatial data on environment

## Atmospheric data

### Gridded data on air-quality indicators

The screenshot shows the website of the Atmospheric Composition Analysis Group at Washington University in St. Louis. The header is red with the university's name. Below it, the group's name is in a large, dark font. A navigation bar contains links for RESEARCH, PUBLICATIONS & PRESENTATIONS, GEOS-CHEM, SATELLITES, DATASETS (highlighted), SPARTAN, and GROUP INFO. The main content area is titled 'Datasets' and includes a paragraph about freely accessible information and data. To the right, a list of datasets is shown: Surface PM2.5, GBD-MAPS - Global, Surface NO2, and Historical PM2.5 across North America.

Washington University in St. Louis

## Atmospheric Composition Analysis Group

RESEARCH PUBLICATIONS & PRESENTATIONS GEOS-CHEM SATELLITES **DATASETS** SPARTAN GROUP INFO

### Datasets

Freely accessible information and data have greatly advanced scientific development during the past decade. We have posted several of our products in the spirit of this belief.

Users are asked to familiarize themselves with corresponding publications and contact principle researchers (as provided within subsequent sections) to ensure the most up-to-date and appropriate use of information.

Datasets

- Surface PM2.5
- GBD-MAPS - Global
- Surface NO2
- Historical PM2.5 across North America

### Demonstration:

Atmospheric Composition Analysis Group (PM2.5, NO2..)

<https://sites.wustl.edu/acag/datasets/>

### Data based on ground observations

The screenshot shows the European Environment Agency website. The header is white with the agency's logo and navigation links: Topics, Countries, Data and maps, Indicators, Publications, Media, and About. Below the header, a breadcrumb trail reads: Data and maps > Datasets > Interpolated air quality data. The main content area is titled 'Interpolated air quality data' and includes a paragraph about interpolated maps showing air quality in Europe.

European Environment Agency

Topics Countries Data and maps Indicators Publications Media About

> Data and maps > Datasets > Interpolated air quality data

## Interpolated air quality data

Interpolated maps showing air quality in Europe. The dataset has been reorganised in order to improve data harmonization among years and to facilitate storage and processing of the interpolated maps for the EEA data services.

# Sources to access spatial data on environment

## Land use / Land cover data

- Pre-processed data sets:
- Multiple sources of data (varying in spatial resolution, temporal scales, methods, and categories)

### 1. Esri Land Cover 10m

### Demonstration:

ESRI living Atlas (ready to use LULC data)

<https://livingatlas.arcgis.com/landcover/>

### 2. Global Land Survey (GLS)

More details and other sources:

<https://gisgeography.com/free-global-land-cover-land-use-data/>

# Sources to access spatial data on environment

## Satellite imageries

**MODIS** : the Moderate Resolution Imaging Spectroradiometer on NASA Terra ( and Aqua) satellite(s)  
(temperature data retrieved at the moment)

« viewing the entire Earth's surface every 1 to 2 days, acquiring data in 36 spectral bands - These data will improve our understanding of global dynamics and processes occurring on the land, and in the lower atmosphere.

**SENTINEL** : The Copernicus Program is an ambitious initiative headed by the European Commission in partnership with the European Space Agency (ESA). The Sentinels include all-weather radar images from Sentinel-1A and -1B, high-resolution optical images from Sentinel 2A and 2B, as well as ocean and land data suitable for environmental and climate monitoring from Sentinel 3.

## How to access them ?

Copernicus - Google Earth Engine –Earth Explorer

### Demonstration:

NASA: earth explorer (satellite images)

Platform to access satellite images for specific times and regions...

<https://earthexplorer.usgs.gov/>

# Sources to access spatial data on environment

## Global gridded population data

From **GPW** (gridded population of the world) in 1995 [1kmx1km, little modelling (areal weighting/Protected areas and water bodies)]

... to **GRUMP** from 2011 (a little more modelling, using night lights)

... to **Worldpop** today [100m x 100m, more modelling (machine learning / Roads, land cover, built structures, cities or urban areas, night time lights, infrastructure, environmental, protected areas, and water bodies)]

### Demonstration:

PopGrid: a compilation of different gridded data for demographic indicators <https://www.popgrid.org/>  
<https://worldpop.org>

# Hands-on session in QGIS

## Objective

- Estimating climate data for the administrative units (cantons) of France
- Importing remotely sensed data
  - Reading data
  - Data editing
  - Geo-processing
  - Extraction of indicators at desired spatial scale

	NAME_4	VARNAME_4	TYPE_4	ENGTYPE_4	_tmaxcount	_tmaxsum

# Side by side things!

## Map projection

- Earth's surface in two dimensions is always with distortion.
- Thus, different map projections: to minimize the errors in shape and area.

### Three families of map projections

- a) **Cylindrical projections**  
preserve distances or areas
  - b) **Conical projections**  
preserve angles
  - c) **Planar projections**  
preserve distances
- All projections have advantages and disadvantages
  - Distortions of angular conformity, distance and area

# Side by side things!

## Map projection

### World UTM Zones

For this area of  
interest (Part of  
Europe)  
30-35 N zone is ideal

N

S

## Side by side things!

**Raster calculator is important to perform calculations over your raster.**

For instance,

to convert temperatures in degrees Fahrenheit to Celsius

**$(\text{Raster layer} - 32) \times .5556$**

to calculate NDVI (Normalized difference vegetation index)  
from multispectral satellite images

**$(\text{NIR} - \text{R}) / (\text{NIR} + \text{R})$**

Also to apply weights or to make criteria based selection of indicators

**Land surface temperature > 40 degree Celsius**

# Avoid common errors during raster processing

## Right choice of projection

- For the objectives related to distance (proximity, buffer, area, etc.) projection unit must be in meters/km/mile.. (not as degrees)
- Idea is UTM projection.
- Match the projections of all layers (vector/raster)

## Fix geometry of shapefile before processing

Check the online **USER MANUAL** for QGIS

[https://docs.qgis.org/3.22/en/docs/user\\_manual/](https://docs.qgis.org/3.22/en/docs/user_manual/)

Don't  
**PANIC!**

Errors are common in  
RS and GIS

## Acknowledgements

- ❖ IUSSP team: Nico van Nimwegen, Paul Monet, Mary Ellen Zuppan, and Shireen Jejeebhoy for organizing this webinar and providing necessary intellectual support.
- ❖ Big thanks to Valérie Golaz from INED, who has helped in conceptualizing and design the course.
- ❖ My team members of the Early Career Perspective Panel at IUSSP
- ❖ Enthusiastic participants from various parts of world
- ❖ Léo Lipovac and Basile Rousse (INED) for extending help during the webinar.
- ❖ French Institute for Demographic Studies (INED), France.

# Thank you!
